WELCOME TO

NO GODS OR KINGS. ONLY MAN.

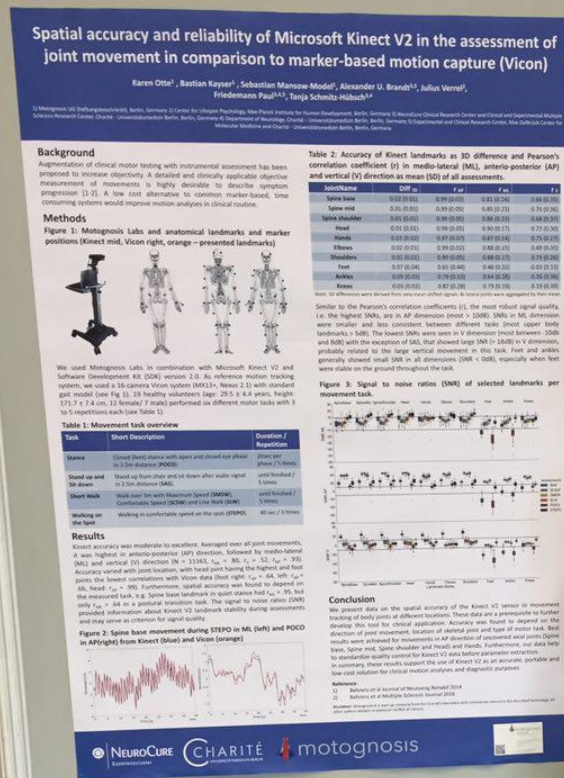

Me, myself and the Cat.

motognosis

We understand motion.

A scene from the television series Star Trek: The Next Generation. Geordi La Forge, played by LeVar Burton, is seated at a control console in the ship's bridge. He is wearing his standard black and gold Starfleet uniform. A small, fluffy, light-brown dog named Spot is sitting on his lap, facing away from him towards a computer monitor. Geordi has a slightly annoyed or exasperated expression on his face. The background features various futuristic control panels with glowing blue and green lights, and a large screen displaying a yellow wireframe model of a Klingon Bird-of-Prey. The overall lighting is dim, typical of the bridge's interior.

Spot, you are disrupting
my ability to work.

Dialysis? My god, what is this?

Messung starten

Das Protokoll sollte mit geschlossenen Augen in ca. 2 km Abstand zum Messgerät stehen. Nach dem Start wird die Messung automatisch durchgeführt. Es wird zunächst eine Phase mit offenen Augen, anschließend eine Phase mit geschlossenen Augen gemessen.

Entfernung Protokoll: 2.53 m
Sensorenwinkel: 6.1°

One pixel attack for fooling deep neural networks

Jiawei Su, Danilo Vasconcellos Vargas, Sakurai Kouichi

(Submitted on 24 Oct 2017)

Recent research has revealed that the output of Deep neural networks(DNN) is not continuous and very sensitive to tiny perturbation on the input vectors and accordingly several methods have been proposed for crafting effective perturbation against the networks. In this paper, we propose a novel method for optically calculating extremely small adversarial perturbation (few-pixels attack), based on differential evolution. It requires much less adversarial information and works with a broader classes of DNN models. The results show that 73.8% of the test images can be crafted to adversarial images with modification just on one pixel with 98.7% confidence on average. In addition, it is known that investigating the robustness problem of DNN can bring critical clues for understanding the geometrical features of the DNN decision map in high dimensional input space. The results of conducting few-pixels attack contribute quantitative measurements and analysis to the geometrical understanding from a different perspective compared to previous works.

WE DO WHAT WE MUST
BECAUSE WE CAN

“Data is the new oil. It’s valuable, but if unrefined it cannot really be used. It has to be changed into gas, plastic, chemicals, etc to create a valuable entity that drives profitable activity; so must data be broken down, analyzed for it to have value.”

Clive Humby (2006)
